Team TYS

FinTech / AI in Finance · final defence

Mode: Partner product — MKBANK, micro & family-business credit department

Partners: MKBANK and the Central Bank of Uzbekistan · October 2026

Live prototype https://tys-fintech.vercel.app **Repository** https://github.com/hmunisbekk-droid/TYS-fintech

The regulation names the evidence — the self-employed have exactly one line

CBU Regulation No. 3618 for banks, cl.19 — documented income; cl.18 — receipts on the borrower's accounts

- **Employer-confirmed salary** — no employer — the borrower is the business
- **Pension** — working-age applicant, not a pensioner
- **Funded-pension contributions** — none: contributions come through an employer
- ✓ **Receipts credited to the borrower's bank accounts (cl.18)** — the only line a self-employed borrower has
- **Tax data incl. the annual income declaration** — self-employed income is untaxed; no declaration is filed
- **Interest, dividends, rental income** — rarely applicable; easy to document when it is

50% limit

DBR limit for bank loans (cl.3); income = mean of 6–12 months of receipts (cl.13, cl.18); 50–100% only inside a 15% quota

~140,000

projects MKBANK plans under its lending programmes in 2026 (47,975 micro-projects financed in 2025); 1,062 mahalla agents

60–90 min

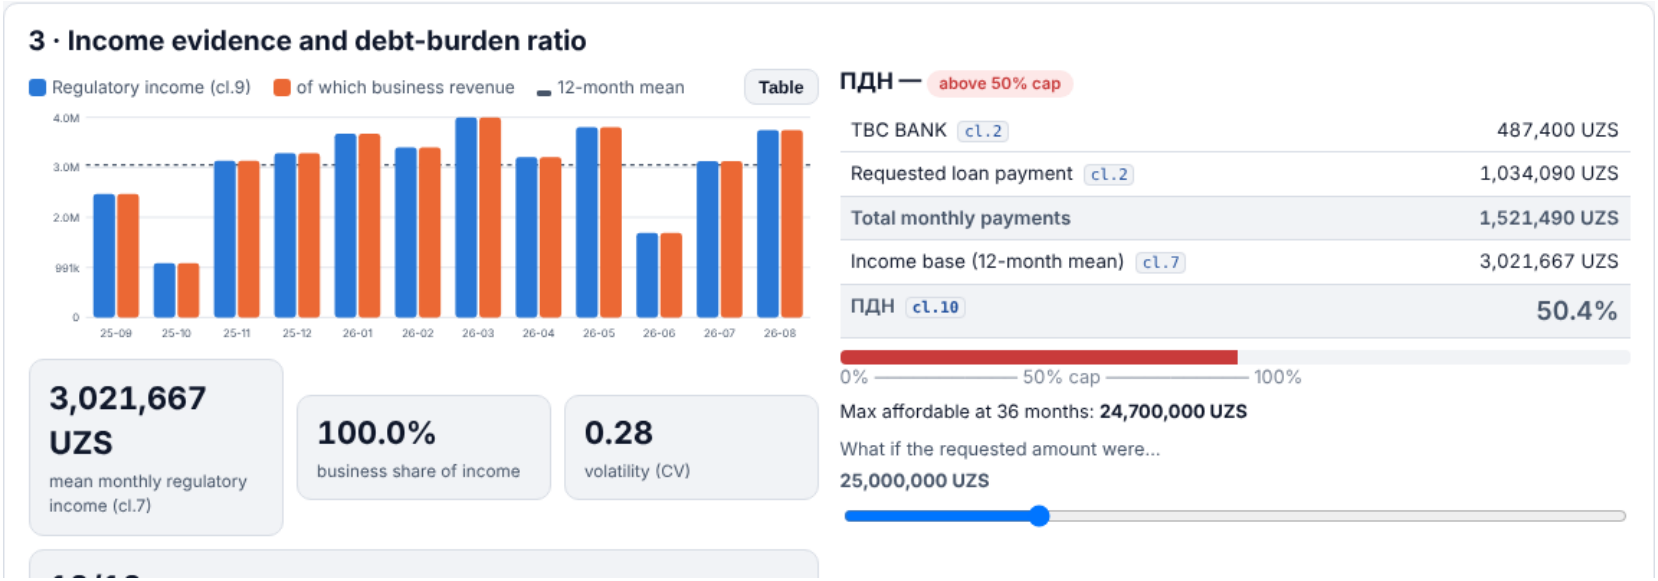

an officer's manual reading of 12 months of statements per application (our estimate; pilot measures it)

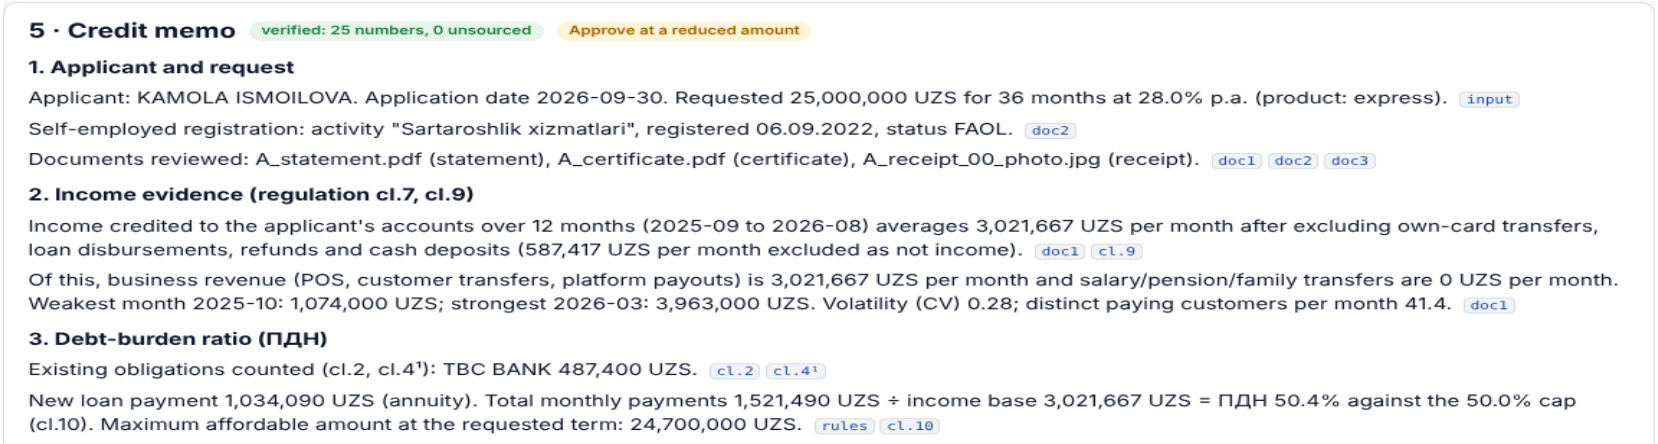

0 lines

of official income records for ~790k registered self-employed (untaxed, unfiled, no cash register required)

Sources: CBU Regulation No. 3618 (Board decision 7/3, 8 Apr 2025; lex.uz/uz/docs/7491592) · spot.uz 27 Mar 2026 (MKBANK, bank's own figures) · yuz.uz (self-employed registrations, 2021) — full list on the References slides

What the officer gets in under five seconds

Regulatory income

cl.13 mean of 6–12 months (median option, cl.14) of account receipts (cl.18); own-card transfers, loan proceeds, refunds and cash deposits excluded

DBR with citations

36/60/180-month spreading, guarantor rule, cl.4 exemptions, 50% limit, the 50–100% quota band and the new-self-employed quota (cl.3), maximum affordable amount

Integrity report

balance chain, duplicates, coverage, gaps, pre-application spikes, circular transfers, holder match

Verified memo

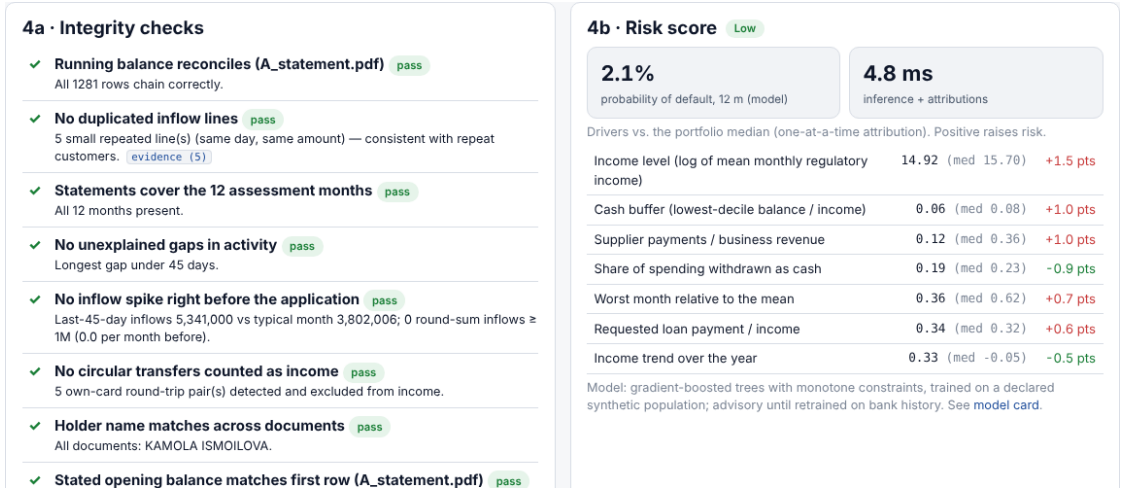

every number traces to its source — statement lines (click to open them), a clause, or the model; the verifier refuses unsourced numbers; hash-chained audit log

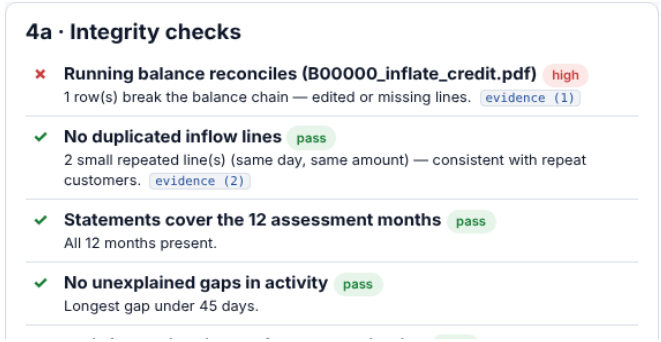

Live demo — on our samples and on anything you upload

Open on your laptop or phone

https://tys-fintech.vercel.app

1. Load sample A — statement PDF, Soliq certificate, receipt photo parse in the tab (no server, no API)
2. Income series, DBR with clause citations, maximum affordable amount; drag the slider to cross the 50% limit
3. Integrity checks and risk score with drivers; click any evidence link to see the statement line
4. Memo: verifier badge shows how many numbers were checked and that none is unsourced
5. Record the decision; export the case with its hash-chained audit log
6. Then: Load tampered statement — the balance chain breaks at the inflated inflow; upload your own documents

Scan to open the live prototype on your phone (New case → Load sample A)

Seven components, one optional language model, zero API keys

1 · Intake

pdf.js with coordinates; XLSX/CSV; tesseract.js OCR uzb+rus+eng, self-hosted; field confidence, tap-to-confirm

2 · Categoriser

multilingual rules + counterparty patterns (recurring payer → family; same mask both ways → own card)

3 · Cash-flow

12-month series; 18 features identical in TypeScript and Python (parity test)

4 · Rule engine

DBR clause by clause (Regulation 3618): 36/60/180-month spreading, guarantor rule, cl.4 exemptions, 50% limit, 15% quota bands, back-solved amount

5 · Risk model

XGBoost, monotone constraints, JSON trees evaluated in the browser; attributions vs portfolio median

6 · Integrity

balance chain, duplicates, coverage, gaps, round-sum spikes, circular transfers, holder match

7 · Memo + audit

template from a fact table; verifier rejects unsourced numbers; SHA-256 hash-chained log

Perimeter

Prototype: static site, every byte of a document stays in the browser. Production: the same bundle on the bank's server, SSO, audit log in the bank DB, core-banking pull for own customers. LLM optional, narrative only, behind the same verifier.

Speed: statement 1.2–1.8 s · receipt OCR 1.6 s · everything else < 50 ms · marginal cost per application: zero

Human in the loop: the engine recommends and computes the maximum affordable amount; the officer decides; an override needs a reason, written into the chain.

Measured through the real app, not typed into a slide

60/60

generator PDFs: exact rows, balance chain reconciled (2 layouts, RU/UZ)

8/8

unseen layouts exact — CSV/XLSX/TSV variants incl. a wallet export (list on the model card)

40/40

tampered statements caught, 4 tamper types; 0 false alarms on clean ones

95%

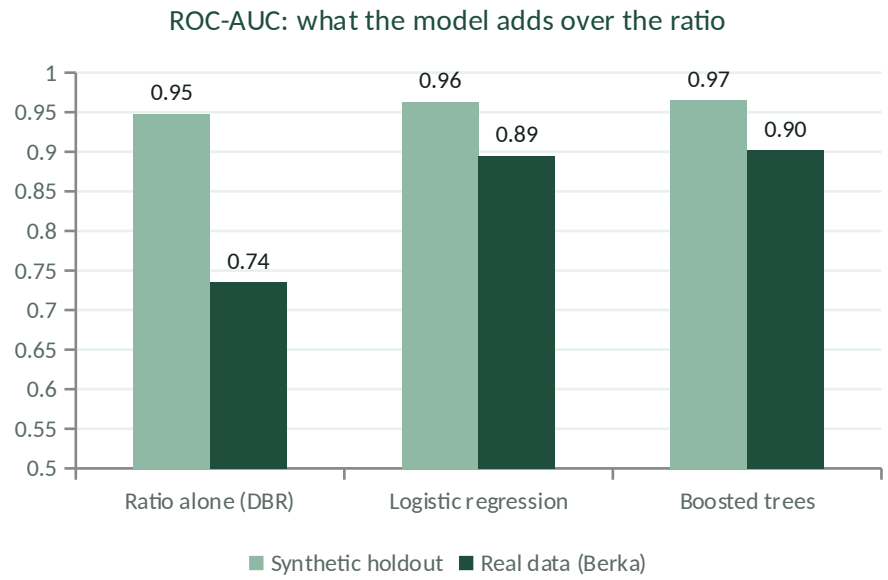

receipt OCR total exact, 60 camera-augmented photos; INN 100%, date 97%

0.965

ROC-AUC, synthetic holdout n=500; logistic 0.963, ratio alone 0.948

0.902

ROC-AUC, real bank data (Berka, 443 loans, 44 bad; 95% CI ≈ 0.86–0.94); ratio alone 0.735

Honest reading: on synthetic data the ratio already carries most of the signal by construction; on real statements the cash-flow features add +0.17 AUC over the ratio, and logistic regression comes close to the trees — we ship the trees for the monotone constraints and non-linear thresholds, not for the last 0.01. Categoriser: 99.96% on 10,481 lines of the generator's own vocabulary — will fall on real data. Memo verifier: 0 unsourced numbers across a 300-scenario sweep (amounts × terms × products × borrowers), enforced at run time.

All numbers are read from JSON produced by ml/train.py, ml/berka_validate.py, npm test and tests/*_eval.py (see the Model card page).

Caveat on the slide, not in the footnote: the risk score is advisory until retrained on the bank's own history inside the perimeter — that is the pilot's first deliverable.

No partner data, so we built a declared generator

1

Archetypes

10 trades (tailor, taxi, dehkan farmer, grocer, reseller, tutor…) with declared seasonality, customer counts, channel mix, expense structure

2

Simulation

2,000 borrowers · 5,689,589 transactions · existing loans with annuity schedules · shocks · default label from a latent affordability score (10.5% rate)

3

Rendering

60 statement sets as PDF (text layer) + XLSX + CSV in RU and UZ layouts; 180 fiscal receipts; Soliq-style certificates with QR

4

Camera model

perspective, rotation, lighting gradient, blur, sensor noise, JPEG — then measured through the same OCR the officer uses

5

Tampering

40 statements: inflated inflow, deleted debit, duplicated row, window dressing — labelled for the integrity evaluation

Xaridingiz uchun rahmat!

Synthetic statement (Humo-style layout, Russian labels) and a camera-augmented synthetic fiscal receipt. No real person is represented; names come from a short public list, card numbers are random and masked.

```
Regenerate:  python -m synth.cli --n 2000 --render 60 --
receipts 180 --tamper 40 --seed 42
```

Also: methodology check on real anonymised bank data (Berka, PKDD'99) — not redistributed, downloaded by script.

Pilot: three months, five branches, fifty mahalla agents

Cost to build and run the pilot (assumptions, UZS)

Line	Assumption	3-month cost
Team: 3 engineers/analysts (TYS)	3 × 3 months × 15M	135M
Bank credit analyst, part-time	0.5 FTE × 3 months × 15M	22.5M
Infrastructure	1 VM in the bank DC, no GPU	≈ 3M
Integration (core banking, bureau)	bank IT, 20 person-days	≈ 30M
Data, licences, API spend	none — open-source, no external API	0
Total pilot (≈ $15k)		**≈ 190M**

Running cost per application: zero marginal (static bundle; no API, no GPU). Optional narrative LLM on one on-prem GPU: well under 1 US cent per application.

Timeline: month 1 shadow mode (engine runs beside the manual process; we measure minutes and agreement) · months 2–3 assisted mode (officer works from the memo) · success metrics: minutes per application, agreement with committee, override rate, DBR audit findings, retrained model AUC on bank history.

Value — the officer-hours formula (every term is a slider)

90 → 25 min

document handling per application, before → with Daromad (assumption 1; the pilot measures it)

≈ 42,000 / yr

addressable applications: 30% of MKBANK's 140,000 micro-projects (bank's own 2026 target) — those outside the cl.4-exempt family programme (assumption 2)

≈ 45,000 h

officer-hours saved per year = 42,000 × 65 min ≈ 23 FTE-years at 2,000 h

≈ 4.1 bn UZS/yr

23 FTE × 15M/month × 12 — officer time only; at a 10% addressable share ≈ 1.4 bn

Payback: the ≈ 190M pilot itself (5 of 181 branches, 3 months) does not pay back — it measures the two assumptions. After roll-out the saving of ≈ 4.1 bn/yr repays the pilot within its first month; at a 10% addressable share, within two months. Not counted: faster time-to-decision for the borrower, fewer DBR compliance findings, better risk selection — claimed only after the pilot measures them.

Who pays: MKBANK (credit department / digital budget). Who owns: micro & family-business credit department; IT deploys; mahalla agents and loan officers use it.

Hard to copy in a weekend — and what comes next

The replication test — what the same LLM tools do not give you

- Statement parsers that learn columns from the data rows (two Uzbek layouts today, any text-layer PDF, XLSX, CSV) and reconcile the balance chain
- A categoriser lexicon in Uzbek Latin, Cyrillic and Russian with counterparty-pattern rules — and the pilot plan to grow it on bank data
- A rule engine mapped clause by clause to the live bank regulation (No. 3618), with its exemptions, quota bands and the back-solved maximum amount
- A memo verifier that makes unsourced numbers impossible — zero hallucination by construction, no LLM needed
- A declared, calibrated synthetic population with rendered documents, a camera model and labelled tampering — a test bed the bank can keep using
- Evaluation through the real app, reproducible with one command each

Next steps

- Week 1–2: scanned-statement OCR page by page; lexicon growth on anonymised bank descriptions; Uzbek/Russian memo templates
- Month 1: shadow mode in 5 branches; core-banking pull for MKBANK's own account holders; credit-bureau REST for obligations
- Month 2–3: assisted mode; retrain the risk model on bank history inside the perimeter; set risk bands with the bank's risk appetite; fairness review by region
- After the pilot: Central Bank conversation — the same engine computes DBR uniformly for any lender, a supervisory check at zero marginal cost
- Product scope today: Ommabop 2, Express, Business Online 2 (DBR applies) and family-programme loans (exempt from the cap, capacity still assessed)

Daromad

Income evidence for borrowers who have no payslip — regulation-native, perimeter-native, verified.
